

DOUBLEDONE × CLAUDE · SETUP

Connect Claude to DoubleDone

Let Claude add tasks, see your day, tick things off, and break a dreaded task into steps, all in your DoubleDone. It acts **only as you**, and it takes about a minute.

First, one thing: you need a DoubleDone account. If you have never signed in, open doubledone.app and sign in with your email once. A connector signs you in, it can't create the account for you.

In Claude (claude.ai or Cowork)

The easy path. Paste a link, sign in with a code, done. No token to copy.

- 1 Open **Settings** → **Connectors** → **Add custom connector**.
- 2 Name it **DoubleDone**, and paste this URL:

```
https://api.doubledone.app/mcp
```
- 3 Claude opens a small DoubleDone sign-in page. Enter your **account email**, then the **6-digit code** it emails you.
- 4 A consent screen shows exactly what it may do (add, list, and complete your tasks) and **where access is sent**. Read it, then click **Allow**.
- 5 That's it. Ask Claude something like "what's on my DoubleDone today?"

◆ Nothing to re-paste later. The connection quietly refreshes itself, so it keeps working day to day.

Try saying

Add *Add "book the dentist" to my DoubleDone*

Today *What's on my DoubleDone today?*

Week *What's coming up this week?*

Done *Tick off the groceries*

Break down *Break "do my tax return" into small steps*

Using Claude Code instead?

Developer clients connect with a token rather than the sign-in page. Grab yours in the app: [Settings → AI agent access \(MCP\) → Copy my token](#) (you must be signed in). Then run one line:

```
# paste your token where shown
claude mcp add --transport http doubledone https://api.doubledone.app/mcp \
  --header "Authorization: Bearer YOUR_TOKEN_HERE"
```

The token refreshes about hourly; if the agent ever stops connecting, re-copy it. (Cursor and the MCP Inspector work the same way, Streamable HTTP transport, same URL, same bearer header.)

Good to know

- ✓ **It only ever acts as you.** The server holds no master key; every action runs under your own account's security and can't touch anyone else's tasks.
- ✓ **Break-it-down proposes, never adds.** It shows you the steps and adds nothing until you say yes.
- ✓ **Delete is recoverable.** A removed task is tucked away and syncs, never truly destroyed.
- ✓ **Disconnect anytime.** [Settings → AI agent access \(MCP\) → Disconnect AI connectors](#) cuts access immediately.
